Certification Project

Problem Statement

edureka!

Version 1.0

Certification Project: Problem Statement

→ To get the certificate, you have to build an Employee Directory App using Node, Express, MongoDB and AngularJS. The application should have all four CRUD (Create, Read, Update, Delete) operation. User should be able to add new employees, edit an employee details, delete an employee record.

→ Even though we didn't covered AngularJS during the class but you should read it on your own

→ You should use Angular's $http service to make request to REST API build using Node, Express and MongoDB. You can check the live application here:

https://edureka-mean-stack.herokuapp.com/

→ Note that we ask user the following details: Name, Email, Date of Birth, Department, Gender

→ We don't ask user's age rather we calculate the age of the user from his/her date-of-birth. You can use Bootstrap for the UI but you are allowed to use anything you want for UI

→ Note that on the main page, we show all the Employees stored in the database

If you are able to complete this project, it will certainly prove that you know how to use Node, MongoDB and Express and how to play around AngularJS

Good luck and make sure you try to complete this project. You will learn a lot.
